1 | Introduction

PokèMongo is a gaming application in which users compete each other to build up the best Team choosing from the set of Pokemon available in the environment. Every user can make just one single Team.

1.1 Description

Every Team is composed by up to 6 distinct Pokemons and is assigned to a numerical value based on features and properties of the chosen Pokemons, for ranking purposes.

Users can also navigate through the ranking in order to visualize the best teams (according to the values cited before), most used/caught Pokemons.

The user can also search a specific Pokemon using the Pokedex tool, in which he/she can browse Pokemons according to specific search filters (e.g. Pokemon name, Type, Points...).

Moreover, as a “real” Pokemon Trainer, the user is invited to “Catch ‘em ‘all”, i.e. to catch Pokemon in order to create/update his own team. Thus, it is provided to the user a prefix number of daily Pokeball to be used to try to catch them.

At each Pokemon is associated a probability to catch it, the higher the Pokemon’s value, the lower the probability.

Under discussion are the following ideas:

- Creating a “social” structure in which users can follow each other in order to share his/her own team
- Creating a chat system to pair with the social structure
- Reduce catchable Pokemons to a daily subset of the entire Pokemon Database

1.2 Code Snippets

Other things: let’s show some code snippets!

```
1 import requests
2 import json
3
4
5 #exampleW
6 new_json = []
7 description = ""
```

```

8
9     for i in range(500, 894):
10         response = requests.get(f"https://pokeapi.co/api/v2/
pokemon/{i}/")
11         work_string_json = response.json()
12         response = requests.get(f"https://pokeapi.co/api/v2/
pokemon-species/{i}/")
13         work_string_json2 = response.json()
14
15         for desc in work_string_json2['flavor_text_entries']:
16             if(desc['language']['name'] == "en"):
17                 description = desc['flavor_text']
18                 break
19
20         curr_json = {
21             "id": work_string_json['id'],
22             "name": work_string_json['name'],
23             "weight": work_string_json['weight'],
24             "height": work_string_json['height'],
25             "capture_rate": work_string_json2['capture_rate']
26         },
27         "biology": description,
28         "types": [],
29         "portrait": work_string_json['sprites']['other']['
official-artwork']['front_default'],
30         "sprite": work_string_json['sprites']['
front_default']
31     }
32     print(i)
33     for i in work_string_json['types']:
34         curr_json["types"].append(i['type']['name'])
35
36     new_json.append(curr_json)
37
38     with open('pokemon2.json', 'a', encoding='utf-8') as f:
39         json.dump(new_json, f, ensure_ascii=False, indent=4)

```

Listing 1: Python example

```

84         }
85     }
86 }

```

Listing 2: Java example

2 | Interface Mockup

2.1 Something

The mockup is contained within a rectangular frame. At the top center is the text "PokeMongo" in a bold, sans-serif font. Below this, the label "Email" is positioned to the left of a rectangular input field. The input field is filled with a light gray stippled pattern and has a black 'X' drawn across it from corner to corner. Below the email field, the label "Password" is positioned to the left of another identical rectangular input field with a stippled background and a black 'X'. At the bottom left of the frame, the text "Create an account" is displayed. To the right of this text is a rounded rectangular button with a thin black border, containing the text "LOG IN" in all caps.

3 | Requirements

3.1 Something

- An *unregistered user* can
 - Register
- A *registered user* can
 - Login
 - Consult Pokédex
 - * Search by name
 - * Search by type(s)
 - * Search by Pokédex ID
 - * Search by generation
 - * Search by Pokemon characteristics (i.e, height, weight,..)
 - Consult ranking:
 - * Most popular pokemon
 - * Best team
 - Team handling:
 - * Remove Pokemon from the team
 - * View team
 - * Save modified team
 - * View the value of the team
 - Catching:
 - * Try to catch a Pokemon to add to his team
 - Settings:
 - * Change email
 - * Change password
 - * Change country
 - Logout:
 - * Exit from the account
 - * Return to the sign in window
- An *admin* can

- Add pokemon to the Pokédex
- Remove pokemon from the Pokédex
- The *system* should
 - Daily update Pokeball number of each user

3.2 Non-functional Requirements

//To define

3.3 UML relation diagram

Figure 7: Login Mockup

A user can build up only 1 team: of course, each team has just one owner. A team is composed of a maximum of 6 Pokemons, every Pokemon can be caught by anyone, so can belong to many teams.
